      bit(10) CD_ID; // event sink - command descriptor ID
}
```

                                        FIG. 8

CommandRoute

Node interface

```
CommandRoute {
    eventIn       SFBool    Execute              FALSE
    field         SFUrl     CommandDescriptor    []
}
```

Functionality and semantics

The **CommandRoute** node is used to support server interaction. A command route is executed when an event is received on the **execute** field, for example, from a touch sensor. The execution of a command route involves communicating the command pointed by the **commandDescriptor** to the server. The **commandDescriptor** field contains either a URL to the command descriptor or the ID of the Command Descriptor to be associated with this **CommandRoute** node. Commands are typically sent to a server using DMIF's DAI_User_Command primitives. The node update mechanism can be used to change the command descriptor ID. This allows supporting different interaction behavior for the same user interaction at different times (before and after node update).

FIG. 9

Command Name	Command ID
Unused	0X0000
Start	0X0001
Stop	0X0002
Pause	0X0003
Forward	0X0004
Reverse	0X0005
ContentSelection	0X0006
MPEG-4 reserved	0X0007 - 0X00FF
User Defined	0X0100 - 0XFFFF

FIG. 10

```
class Commmand {

      // command ID
      bit(16) CommandID;

      // the following are simply copied from the command descriptor
      // stream count; number of ES_IDs associated to this message
      unsigned int (8) count;

      // ES_Id of the streams
      unsigned int (16) ES_ID[count];

      // application-defined parameters
      do {
            unsigned int (8) paramLength;
            char (8) commandParam [paramLength];
      }
      while (paramLength!=0);
}
```
